

Tip of the Month – December – 2019

Mini-milker.

Although we would like to see a cow being milked in the milking robot as soon as possible after calving, it is simply not always possible. Either the cow is too labile after calving, or too sick, or the distance is too far, or for whatever reason it is not possible or not safe.

Fortunately there is a mini milker. This is a useful device, but it milks the most vulnerable cows in your company.

Pay extra attention to ensure that this mini milker is clean, and that on the mini milker as well as on VMS, the rubber liners, pulsation, milk hoses, etc. are well cleaned, function well and do not give an extra chance of infection or poor milkings to these vulnerable cows.
