

Tip of the Month – January 2020

A smooth feeding area (in front of the feeding fences)

When the feeding spot in front of the feeding fence is nice and smooth, you can move the feed more easily and clean up the feed residues easily. Besides that, the cows also eat cleaner.

Rough floors are harder to keep clean and more fungi and bacteria hide in them. That means the food is less tasty, it sometimes stinks.

The cow's nose is, not coincidentally, very close to the mouth and the result is logically: less feed intake. And with feed intake, some fungi, pathogens and infections come in easily. A rough feeding place is not only for feed intake, and therefore milk production but also bad for the resistance of the cow.

So, investing in a smooth eating area is not a luxury.
