

Tip of the Month – May 2023

Milking speed per bull.

Livestock improvement organizations not only want to know the production of the daughters of their bulls, but also ask about milking speed, behaviour, etc. .

Now this can easily be found in DelPro, but per cow and not per father.

DelPro has many lists and almost anything can be made for wishes or clear overviews tailored to your company.

We have also made a list to view the milking speed of the offspring per bull. With possibly incomplete milkings, who kicks off most often, etc.

But for those who milk with VMS Classic the Performance Index is also included .

That is a figure that indicates how quickly the cow is connected.

(See previous Performance Index Tip)

A list with information per bull is especially interesting when there are more daughters of the same bull.

And it is of course important that the fathers are entered in DelPro!

Do you want this list?
