Tip of the Month - May 2024

Sieves on separation jugs.

It's getting warmer again and that often means more flies... It also sometimes splashes happily around the jugs for separation milk, which is a treat for the flies. To prevent splashing and fly nuisance, you can easily place sieves with a diameter of $18-20\ \text{cm}$ on the

separation jugs. These must be made of metal because then the meshes or wires are thinner and that means less splashing. So no plastic strainers.
