

# Tip of the Month – February 2026

## **Shut down and restart the robots and computer regularly.**

We know it's good to completely shut down and restart the robot(s) and computer occasionally. We know that's good, but when do we do it?

A technician advised using that moment to shut down everything when replacing the teat liners. This way, it happens regularly and takes almost no time!

Make sure you give the system time to drain all (leakage) power.
