

Tip of the Month – April 2026

Sharing experiences.

Occasionally, we receive questions such as:

- My somatic cell count won't drop below 150
- My Germ count fluctuates a lot or is actually too high.
- My acidity level in milk is too high.
- I still have quite a few cows / heifers to collect.
- It takes a long time for the heifers to come in 3 times a day after calving.
- Colleagues have seen a much greater increase in milk production since getting the milking robot than we have?
- The number of milkings drops quite significantly after the cows go out to pasture.
-

Do you also have questions like these?

There is so much experience by now, and there are so many colleagues who don't have these problems or have a solution for it!

Take your questions to colleagues, your advisor, or study meetings.

Of course, much of the information is already available somewhere on this website; your question can often be found using the search function.

And: Be open to solutions ☐
